

INVARIANCE AUDITS FOR ROBOT POLICIES: ICLR MAIN-CONFERENCE GATE ARCHIVE

Anonymous authors

Paper under double-blind review

ABSTRACT

This document is not an ICLR main-conference submission. It is the v3 main-conference gate for a generated robotics draft about robot policy evaluation. The original research bet was: Audit which policy invariances are physically valid and which erase necessary distinctions. After a stricter hostile review, the honest terminal decision is **KILL/ARCHIVE**. Submission-hardening version: v3.

1 GATE DECISION

The v2 paper was workshop-only. Under the active ICLR-main standard, that is insufficient. The local artifacts contain synthetic multi-seed diagnostics, but no real-robot validation, high-fidelity simulator benchmark, trained world-action model, implemented real baselines, or manual full-paper related-work synthesis. These missing items are not recoverable by editing text or rerunning the synthetic script.

2 FATAL ICLR-MAIN BLOCKERS

- Evidence is synthetic and generated from a shared batch template.
- Baselines are diagnostic probability models, not implemented competing robot systems.
- Ablations do not correspond to a trained model checkpoint.
- No hardware, high-fidelity benchmark, qualitative rollouts, or failure videos are available.
- Related work is based on pool slices and hostile metadata, not a manual full-paper synthesis.
- Claims would be misleading if framed as ICLR-main empirical robotics evidence.

3 HOSTILE PRIOR-WORK PRESSURE

The closest local hostile records include:

- SQP-Based Mobile Manipulator Motion Planning With Controlled Infeasibility for Physically Valid Task Failure (2013)
- The Design and Evaluation of an Ergonomic Contactless Gesture Control System for Industrial Robots (2018)
- Coordinated Robustness Evaluation Framework for Vision-Language Models (2025)
- The Evaluation Bottleneck of Vision-Language-Action Models: A Evaluation-Centric Survey (n.d.)
- Cobot User Frame Calibration: Evaluation and Comparison between Positioning Repeatability Performances Achieved by Traditional and Vision-Based Methods (2021)

These works make generic world models, uncertainty, model-based planning, and robot policy robustness crowded. Without real empirical evidence, the remaining novelty boundary is too weak for ICLR main.

4 WHAT REMAINS USEFUL

The archive is still useful as an idea seed and reproducibility scaffold. The synthetic code, stress-test CSVs, reviewer attacks, and novelty-boundary docs can inform a future project. The correct next step is not more paper polishing; it is new evidence: implemented models, real baselines, manual related work, and robot or high-fidelity simulator validation.

5 TERMINAL ACTION

Decision: **KILL/ARCHIVE for ICLR main**. Do not submit this paper to ICLR main in the current form. Revival requires a substantially new empirical project.
